TimeLapse

How does TimeLapse work?

TimeLapse project
2021-2024

TimeLapse periodically takes snapshots according to predefined frequency. Snapshots are uploaded into the cloud with a local backup on the SD card.

You can set how often the camera will take a shot and store it in the cloud - from every 5 minutes to 24 hours interval. The length of the time-lapse is only limited by the time the camera has the service activated.

You can easily compare two images captured at different times in a split view to identify changes over time. You can choose what parts of the time-lapse to export by selecting a specific time period, such as footage from 7 AM to 5 PM.

You can receive regular pictures or shorter time-lapses directly in your inbox. Set any day and interval of your choice via TimeLapse routines in a few clicks.
